Lab 3
DOM and Event Handling Drills

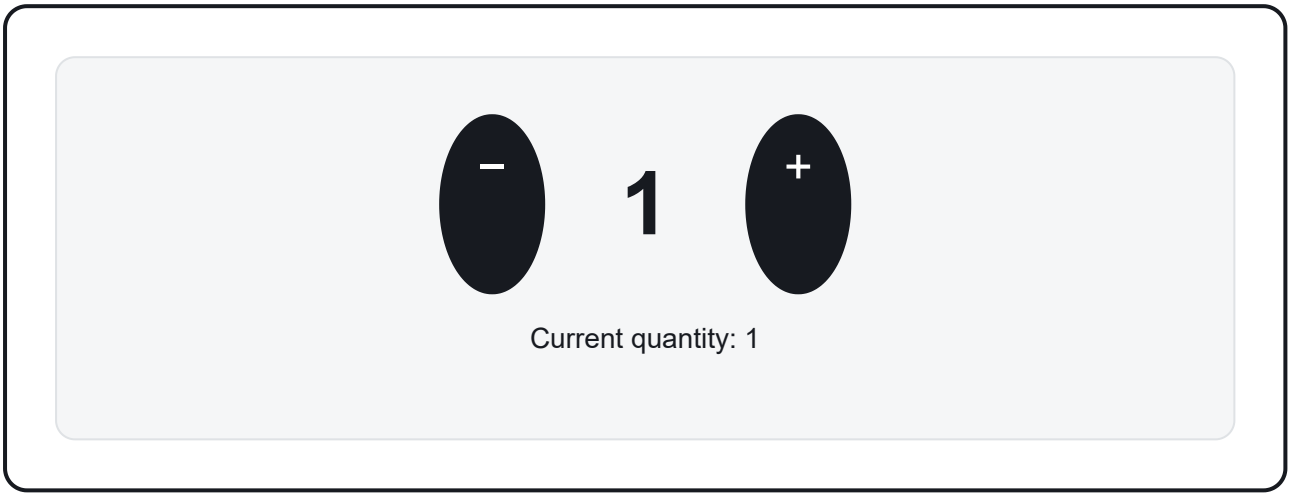

Three small JavaScript exercises demonstrating DOM selection, event listeners, live updates, array filtering, and regular-expression validation.

Student: Hussnain Ali · Reference theme: Tesla

01 · QUANTITY STEPPER

Plus and minus controls

The quantity is stored in a JavaScript variable. Each button click changes the variable and calls one update function. **Math.max(1, quantity - 1)** prevents the value from going below 1.

Increase works

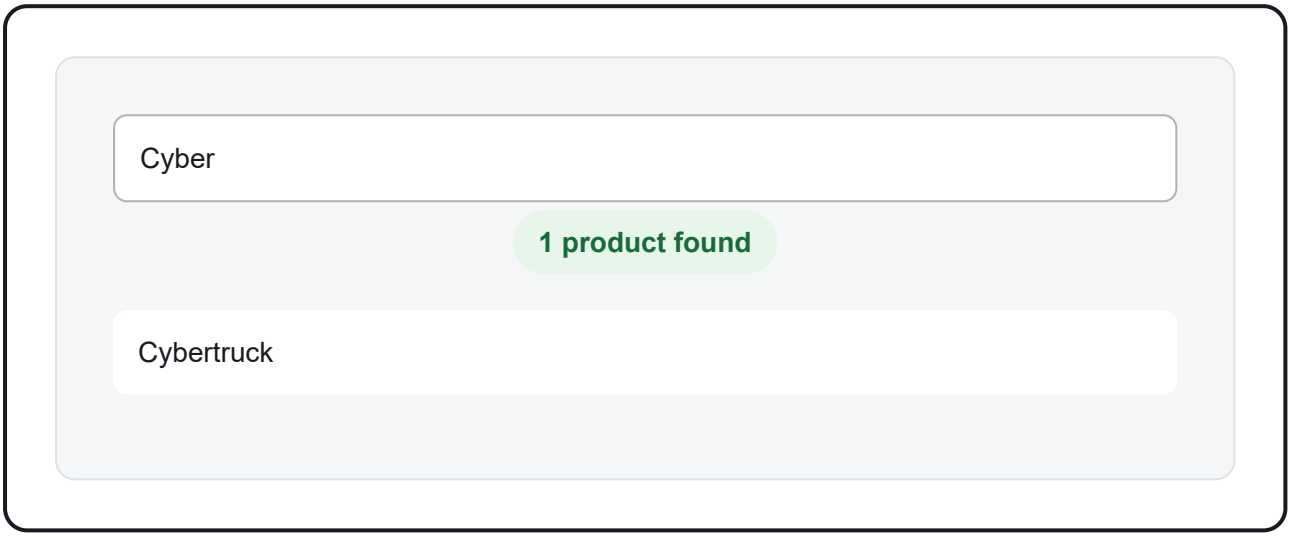

Decrease works

Minimum is 1

02 · LIVE SEARCH

Filter while typing

The input event runs every time the user types. The hardcoded list of 10 product names is filtered with **filter()**, then the matching list is rendered without a page reload.

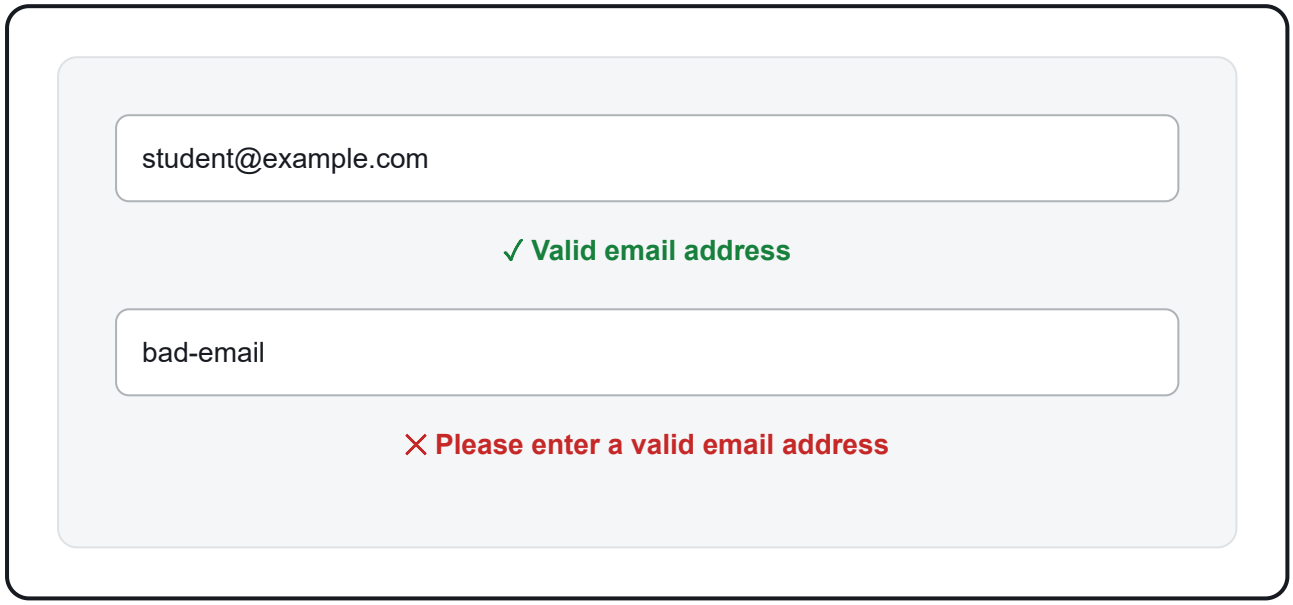

10 products available | Instant filtering | No page reload

03 · EMAIL VALIDATION

Real-time regular expression check

The email input listens for the input event. A regular expression checks the value and changes the message class to show a clear red error or green success result.

Regex validation | Green success state | Red error state
